

Oracle Order Management Cloud Consultant - Implementation

Apply Now

Company: Cloud Hire

Location: India

Category: office-and-administrative-support

We are hiring for the below,
Experience :5+ yrs
Location;
Remote
- Should have done at least 2~3 Order to Cash implementation in Fusion
- Should have experience with Order Management & Pricing Modules at least 4+Years
- Should have excellent communication skill
- Manage Orders Across Channels
- Order Management can support your global, order-to-cash process that uses more than one channel.
- Centralize and manage order capture across channels, do order promising, orchestrate fulfillment policies, monitor order status, and manage exceptions. Create and price each sales order directly in Order Management.
- Create sales orders directly in Order Management. Enter details for a new sales order, revise a sales order, modify order lines, view change history, place a sales order on hold, or cancel a sales order.
- Create a return order for an existing sales order.
- Use a common definition of sales orders across channels so you can view and search them in a consistent way.
- For example, search for Item A across sales orders that other users created in Order Management, and across sales orders that an administrator imported from an e-commerce site, call center, or through electronic data interchange (EDI).
- Use an orchestration process to route and manage each sales order across more than one fulfillment system. For example, use a schedule, ship, and bill process to route order lines to two different enterprise resource planning (ERP) systems.
- Send status updates from more than one fulfillment system to a capture system that resides outside of Order Management.
- For example, return a SHIPPED order status to an e-commerce system even if one warehouse

system returns a Shipped status for an order line, but another warehouse returns an SHP status for the same line.

- Get a summary of statuses and exception orders. For example, view a graph that displays sales orders that are at risk of missing a promise date.

- Use Global Order Promising to collect supply data from more than one source and to set up business rules that automatically select the best fulfillment location to meet demand from any channel.

- Select according to future availability, expected delivery date, and preferred delivery method. Allocate scarce supply according to customer, channel, or to resolve order

Use a mixture of cloud and on-premise environments for your capture and fulfillment systems.

- For example, import source orders from a cloud capture system, then fulfill them in an on-premise ERP system.

- Use a predefined integration with other Oracle cloud services to centrally manage orchestration policies, get global availability, monitor status, and manage exceptions.

- Import source orders from your order capture system, such as an e-commerce system, edit them in Order Management, and then fulfill them in your fulfillment system.
